```c
struct Date
{
    int day;
    int month;
    int year;
};

void test(void)
{
    struct Date myDate;     // one way to allocate memory
    // THIS IS A POINT FROM WHICH I CAN START ACCESSING INSTANCE NAMED myDate

    // second way to alllocate memory
    struct Date* pDate = (struct Date*)malloc(sizeof(struct Date));
    // THIS IS A POINT FROM WHICH I CAN START ACCESSING INSTANCE POINTED BY
    // pDate

    myDate.day = 4;
    myDate.month = 10;
    myDate.year = 2025;
}

struct Date myDate = {4, 10, 2025};
```

C++ : to initialize an object → a full fledged function might be needed.

Date("4/10/2025");

int day   atoi( )   "4/10/2025"
int month   atoi( )
int year   atoi( )

---

1) which object is created?

2) which object must be initialized?

3) which values should be used to initialize an object?

Date

$\boxed{\text{Date()}}$

CALLBACK FUNCTION.

- You have called many functions
- You've defined functions
- Built-in functions: 1) O.S. system calls.
  2) libraries
  3) compiler/interpreter.
